AB Recombinant **adenoviral** vectors expressing viral replication repressors controlled by a pathway-responsive promoter is described for therapeutic usage. These viral vectors **replicate selectively** in response to the intracellular conditions of the target cell. These repressor genes controlled by **E2F** and **Rb**, or **p53**, or **TGF.beta.** responsive-**promoters** are **selectively** expressed in response to the intracellular conditions of the target cells and subsequently inhibits viral vector **replication** in the host cell based on the phenotypic or genotypic of the infected cell. In the target cell, the promoter element of the pathway-responsive promoter is inactive and thus the virus is permitted to replicate for therapeutic purposes. This results in: (1) killing the cells by natural lytic nature of the virus, and/or (2) provides a therapeutic dose of a transgene product (amplified in comparison to replication incompetent vectors) to the target cell, and (3) producing a localized concn. of the virus facilitating the infection of surrounding cells to the recombinant virus. The invention further provides therapeutic and diagnostic methods of use of the vectors, pharmaceutical formulations comprising the vectors, methods of making the vectors and transformed cells comprising the vectors.
